## 6 **Open Cloud Computing Interface - HTTP Protocol**

### 7 Status of this Document

8 This document provides information to the community regarding the specification of the Open Cloud Computing  
9 Interface. Distribution is unlimited.

10 This document obsoletes GFD-P-R.185.

### 11 Copyright Notice

12 Copyright ©Open Grid Forum (2013-2016). All Rights Reserved.

### 13 Trademarks

14 OCCI is a trademark of the Open Grid Forum.

### 15 Abstract

16 This document, part of a document series produced by the OCCI working group within the Open Grid Forum  
17 (OGF), provides a high-level definition of a Protocol and API. The document is based upon previously gathered  
18 requirements and focuses on the scope of important capabilities required to support modern service offerings.

## 1 Introduction

The Open Cloud Computing Interface (OCCI) is a RESTful Protocol and API for all kinds of management tasks. OCCI was originally initiated to create a remote management API for IaaS<sup>1</sup> model-based services, allowing for the development of interoperable tools for common tasks including deployment, autonomic scaling and monitoring. It has since evolved into a flexible API with a strong focus on interoperability while still offering a high degree of extensibility. The current release of the Open Cloud Computing Interface is suitable to serve many other models in addition to IaaS, including PaaS and SaaS.

In order to be modular and extensible the current OCCI specification is released as a suite of complementary documents, which together form the complete specification. The documents are divided into four categories consisting of the OCCI Core, the OCCI Protocols, the OCCI Renderings and the OCCI Extensions.

- The OCCI Core specification consists of a single document defining the OCCI Core Model. OCCI interaction occurs through *renderings* (including associated behaviors) and is expandable through *extensions*.
- The OCCI Protocol specifications consist of multiple documents, each describing how the model can be interacted with over a particular protocol (e.g. HTTP, AMQP, etc.). Multiple protocols can interact with the same instance of the OCCI Core Model.
- The OCCI Rendering specifications consist of multiple documents, each describing a particular rendering of the OCCI Core Model. Multiple renderings can interact with the same instance of the OCCI Core Model and will automatically support any additions to the model which follow the extension rules defined in OCCI Core.
- The OCCI Extension specifications consist of multiple documents, each describing a particular extension of the OCCI Core Model. The extension documents describe additions to the OCCI Core Model defined within the OCCI specification suite.

The current specification consists of seven documents. This specification describes version 1.2 of OCCI and is backward compatible with 1.1. Future releases of OCCI may include additional protocol, rendering and extension specifications. The specifications to be implemented (MUST, SHOULD, MAY) are detailed in the table below.

**Table 1.** What OCCI specifications must be implemented for the specific version.

Document	OCCI 1.1	OCCI 1.2
Core Model	MUST	MUST
Infrastructure Model	SHOULD	SHOULD
Platform Model	MAY	MAY
SLA Model	MAY	MAY
HTTP Protocol	MUST	MUST
Text Rendering	MUST	MUST
JSON Rendering	MAY	MUST

## 2 Notational Conventions

All these parts and the information within are mandatory for implementors (unless otherwise specified). The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [1].

The following terms [2] are used when referring to URL components:

<sup>1</sup>Infrastructure as a Service

```

98 http://example.com:8080/over/there?action=stop#xyz
99 \_\/ \_-----\/ \_-----\/ \_-----\/ \_\/
100 | | | | |
101 scheme authority path query fragment

```

### 3 OCCI RESTful HTTP Protocol

This document specifies the OCCI HTTP Protocol, a RESTful protocol for communication between OCCI server and OCCI client. The OCCI HTTP Protocol support multiple different data formats as payload. Data formats are specified an separate documents.

## 4 Namespace

The OCCI HTTP Protocol maps the OCCI Core model into the URL hierarchy by binding **Kind** and **Mixin** instances to unique URL paths. Such a URL path is called the *location* of the **Kind** or **Mixin**. A provider is free to choose the *location* as long as it is unique within the service provider's URL namespace. For example, the **Kind** instance<sup>2</sup> for the **Compute** type may be bound to `/my/occi/api/compute/`.

Whenever a *location* is rendered it MUST be either a String or as defined in RFC6570 [3].

A **Kind** instance whose associated type cannot be instantiated MUST NOT be bound to an URL path. This applies to the **Kind** instance for OCCI Entity which, according to OCCI Core, cannot be instantiated [4].

#### 4.1 Bound and Unbound Paths

Since a limited set of URL paths are bound to **Kind** and **Mixin** instances the URL hierarchy consists of both *bound* and *unbound* paths. A bound URL path is the *location* of a **Kind** or **Mixin** collection.

An unbound URL path MAY represent the union of all **Kind** and **Mixin** collection 'below' the unbound path.

## 5 Headers and Status Codes

OCCI clients and Servers MUST include a minimum set of mandatory HTTP headers in each request and response in order to be compliant. There is also a minimum set of HTTP status codes which MUST be supported by an implementation of the OCCI HTTP Protocol.

### 5.1 Requests Headers

**Accept** An OCCI client SHOULD specify the media types of the OCCI data formats it supports in the **Accept** header.

**Content-type** If an OCCI client submits payload in a HTTP request the OCCI client MUST specify the media type of the OCCI data format in the **Content-type** header.

**User-Agent** An OCCI client SHOULD specify the OCCI version number in the **User-Agent** header. See Section 5.3.

<sup>2</sup><http://schemas.ogf.org/occi/infrastructure#compute>

## 129 5.2 Response Headers

130 **Accept** An OCCI server SHOULD specify the media types of the OCCI data formats it supports in the Accept  
131 header.

132 **Content-type** An OCCI server MUST specify the media type of the OCCI data format used in an HTTP  
133 response.

134 **Server** An OCCI server MUST specify the OCCI version number in the Server header. See Section 5.3.

## 135 5.3 Versioning

136 Information about the OCCI version supported by a server implementation MUST be advertised to a client on  
137 each response. The version field in the response MUST include the value OCCI/X.Y, where X is the major  
138 version number and Y is the minor version number of the implemented OCCI version. The server response  
139 MUST relay versioning information using the HTTP 'Server' header.

```
140 HTTP/1.1 200 OK
141 Server: occi-server/1.1 (linux) OCCI/1.2
142 [...]
```

143 Complementing the server-side behavior of an OCCI implementation, a client SHOULD indicate the version it  
144 expects to interact with. In a client, this information SHOULD be advertised in all requests it issues. A client  
145 request SHOULD relay versioning information in the 'User-Agent' header. The 'User-Agent' header MUST  
146 include the same value (OCCI/X.Y) as advertised by the server.

```
147 GET /-/ HTTP/1.1
148 Host: example.com
149 User-Agent: occi-client/1.1 (linux) libcurl/7.19.4 OCCI/1.2
150 [...]
```

151 If an OCCI implementation receives a request from a client that supplies a version number higher than the  
152 server supports, the server MUST respond back to the client with an HTTP status code indicating that the  
153 requested version is not implemented. The *HTTP 501 Not Implemented* status code MUST be used.

154 OCCI implementations compliant with this version of the document MUST use the version string *OCCI/1.2*.  
155 Versioning of extensions is out of scope for this document.

## 156 5.4 Status Codes

157 The below list specifies the minimum set of HTTP status codes an OCCI client MUST understand. An OCCI  
158 server MAY return other HTTP status codes but the exact client behavior in such cases is not specified. The  
159 return codes are specified by [5] and [6].

160 **200 OK** indicates that the request has succeeded.

161 **201 Created** indicates that the request has been fulfilled and has resulted in one or more new resources being  
162 created.

163 **204 No Content** indicates that the server has fulfilled the request but does not need to return a body, relevant  
164 headers MAY be present.

165 **400 Bad Request** indicates that the server cannot or will not process the request due to something that is  
166 perceived to be a client error

167 **401 Unauthorized** indicates that the request has not been applied because it lacks valid authentication  
168 credentials for the target resource.

- 169 **403 Forbidden** indicates that the server understood the request but refuses to authorize it.
- 170 **404 Not Found** indicates that the origin server did not find a current representation for the target resource  
171 or is not willing to disclose that one exists
- 172 **405 Method Not Allowed** indicates that the method received in the request-line is known by the origin  
173 server but not supported by the target resource.
- 174 **406 Not Acceptable** indicates that the target resource does not have a current representation that would be  
175 acceptable to the user agent
- 176 **409 Conflict** indicates that the request could not be completed due to a conflict with the current state of  
177 the resource
- 178 **413 Request Entity Too Large** indicates that the request is larger than the server is willing or able to  
179 process.
- 180 **500 Internal Server Error** indicates that the server encountered an unexpected condition that prevented it  
181 from fulfilling the request.
- 182 **501 Not Implemented** indicates that the server does not support the functionality required to fulfill the  
183 request.
- 184 **503 Service Unavailable** indicates that the server is currently unable to handle the request due to a temporary  
185 overload or maintenance of the server

## 186 6 Pagination

- 187 To request partial results of an otherwise large collection message response, pagination SHOULD be used to  
188 reduce the load on both the client and the service provider. This is done in the following manner.
- 189 The HTTP GET verb is used when accessing a URL of a collection and the query parameters of *page* and  
190 *number* MUST be used. *page* is an indexed integer that refers to a sub-collection of the requested collection.  
191 *number* is an integer of items that SHOULD be displayed in one paged response.
- 192 If *number* is too large for the provider to handle (policy, technical limitations) then an *HTTP 413 Request*  
193 *Entity Too Large* response status code MUST be issued to the requesting client.
- 194 If there is no more content to be served, the response status code issued to the requesting client MUST be an  
195 *HTTP 200 OK* and the response body MUST contain an empty collection.

## 196 7 Filtering

- 197 To request a sub-set of the given collection of **Category** instances or **Entity** sub-type instances, filtering SHOULD  
198 be used to specify the appropriate elements of the collection. Filtering can be performed via the HTTP GET  
199 verb on the `Query Interface` and on various **Entity** sub-type instance collections. The following specification  
200 of the filtering mechanism is in the process of being deprecated and will be replaced by a new mechanism in  
201 the next MAJOR release of the standard. In its current form, the availability of the filtering mechanism is  
202 restricted to rendering formats transportable in HTTP headers.

### 203 7.1 Query Interface

- 204 Filtering on the `Query Interface` SHOULD be performed via the HTTP GET verb by including a **Category**  
205 instance rendering in the HTTP request headers. If supported, the response MUST contain only **Category**  
206 instances related to the given **Category** instance. This includes **Kinds**, **Actions** and **Mixins**.

## 207 7.2 Entity Sub-type Instance Collection

208 Filtering on `Entity` sub-type instance collections SHOULD be performed via the HTTP GET verb by including  
 209 an `Entity` sub-type instance rendering in the HTTP request headers. If supported, the response MUST contain  
 210 only `Entity` sub-type instances with `Attribute` values matching the given `Entity` sub-type instance `Attribute`  
 211 values.

212 Filtering `Entity` sub-type instances by assigned `Mixin` instances is implemented via `Mixin`-defined collections.

## 213 8 HTTP Methods Overview

214 Table 2 provides a brief overview of the HTTP verb usage. For details, please, see the sections below.

Table 2. HTTP Verb Behavior Summary (\* = Supports filtering mechanisms)

Path	GET	POST	POST (Action)	PUT	DELETE
<code>Entity</code> sub-type instance ( <code>/compute/1</code> ).	Retrieve the <code>Entity</code> sub-type instance representation.	Partial update of the <code>Entity</code> sub-type instance.	Perform an action on the <code>Entity</code> sub-type instance.	Create/Update the <code>Entity</code> sub-type instance, supplying the full representation of the instance.	Delete the <code>Entity</code> sub-type instance.
<code>Entity</code> sub-type instance collection ( <code>/compute/</code> ).	Retrieve a collection of <code>Entity</code> sub-type instances*.	Create a new <code>Entity</code> sub-type instance in this collection.	Perform actions on a collection of <code>Entity</code> sub-type instances.	Not Defined.	Remove <code>Entity</code> sub-type instances from the collection.
<code>Mixin</code> -defined <code>Entity</code> sub-type instance collection ( <code>/my_stuff/</code> ).	Retrieve a collection of <code>Entity</code> sub-type instances*.	Add an <code>Entity</code> sub-type instance to this collection.	Perform actions on a collection of <code>Entity</code> sub-type instances.	Update the collection supplying the full representation of the new collection. Including removal and addition of <code>Entity</code> sub-type instances.	Remove <code>Entity</code> sub-type instances from the collection.
Query interface ( <code>/-/</code> ).	Retrieve <code>Category</code> instances*.	Add a user-defined <code>Mixin</code> instance.	Not Defined.	Not Defined.	Remove a user-defined <code>Mixin</code> instance.

## 215 9 HTTP Methods Applied to Query Interface

216 This section describes HTTP methods used to retrieve and manipulate category instances. With the help of  
 217 the query interface it is possible for the client to determine the capabilities of the OCCI implementation it  
 218 refers to.

219 The query interface MUST be implemented by all OCCI implementations. It MUST be found at:

220 `/-/`

221 Implementations MAY also adopt RFC5785 [7] compliance to advertise this location. Should implementations  
 222 wish to advertise the Query Interface using the well-known mechanism then they MUST use the following  
 223 path served from the authority:

224 `/.well-known/org/ogf/occi/-/`

225 The renderings for the `Category` instance and `Category collection` are defined in [8] and [9].

## 226 **9.1 GET Method**

### 227 **Client GET request**

228 The request MAY include a possible filter rendering.

### 229 **Server GET response**

230 The response MUST include a category collection rendering.

231 Upon a successful request a *200 OK* status code MUST be used.

## 232 **9.2 PUT Method**

233 N/A

## 234 **9.3 POST Method**

### 235 **Client POST request**

236 The request MUST include at least one full category instance rendering. It MAY include a category collection rendering.

### 238 **Server POST response**

239 Upon a successful processing of the request, the *200 OK* status code MUST be returned.

## 240 **9.4 DELETE Method**

### 241 **Client DELETE request**

242 The request MUST include at least one full category instance rendering. It MAY include a category collection rendering.

### 244 **Server DELETE response**

245 Upon a successful processing of the request, the *200 OK* status code MUST be returned.

## 246 **10 HTTP Methods Applied to Entity Instances**

247 This section describes HTTP methods used to retrieve and manipulate individual entity instances. An *entity instance* refers to an instance of the OCCI *Resource* type, OCCI *Link* type or a sub-type thereof [4].

249 Each HTTP method described is assumed to operate on an URL referring to a single element in a collection, a URL such as the following:

251 `http://example.com/compute/012d2b48-c334-47f2-9368-557e75249042`

252 The renderings for the *entity* and *action* instances are defined in [8] and [9].

### 253 **10.1 GET Method**

254 The HTTP GET method retrieves a rendering of a single (existing) entity instance.

255 **Client GET request**

256 N/A

257 **Server GET response**

258 The response **MUST** contain an entity instance rendering.

259 Upon a successful processing of the request, the *200 OK* status code **MUST** be returned.

260 **10.2 PUT Method**

261 The HTTP PUT method either *creates* a new or *replaces* an existing entity instance at the specified URL.

262 **10.2.1 Create**

263 **Client PUT request**

264 The request **MUST** contain an entity instance rendering.

265 **Server PUT response**

266 The OCCI implementation **MAY** return either the *201 Created* or *200 OK* status code. If the OCCI implementation returns the *200 OK* status code, an entity instance rendering **MUST** be included as well. In case of the *201 Created* status code, a location (as defined in RFC7231 [5]) **MUST** be included.

269 **10.2.2 Replace**

270 Any OCCI **Links** associated with an existing OCCI **Resource** **MUST** be left intact.

271 **Client PUT request**

272 The request **MUST** contain an entity instance rendering.

273 **Server PUT response**

274 The OCCI implementation **MAY** return either the *201 Created* or *200 OK* status code. If the OCCI implementation returns the *200 OK* status code, an entity instance rendering **MUST** be included as well. In case of the *201 Created* status code, a location (as defined in RFC7231 [5]) **MUST** be included.

277 **10.3 POST Method**

278 The HTTP POST method either *partially updates* an existing entity instance or triggers an *action* on an existing entity instance.

280 **10.3.1 Partial Update**

281 **Client POST request**

282 The request **MUST** contain a partial entity instance rendering of the entity instance to be changed.

283 **Server POST response**

284 The OCCI implementation **MAY** return either the *201 Created* or *200 OK* status code. If the OCCI implementation returns the *200 OK* status code, an entity instance rendering **MUST** be included as well. In case of the *201 Created* status code, a location (as defined in RFC7231 [5]) **MUST** be included.

### 287 **10.3.2 Trigger Action**

288 Actions are triggered using the HTTP POST verb and by adding a query string to the URL. This query MUST  
289 contain a key-value pair. The key MUST be 'action'. The value MUST equal to the **Action**'s term.

#### 290 **Client POST request**

291 The request MUST contain an action invocation rendering.

#### 292 **Server POST response**

293 The HTTP GET response MAY contain an entity instance rendering or a **Category** instance rendering depending  
294 on the requirements of the specified **Action**.

295 Upon a successful processing of the request, the *200 OK* status code MUST be returned.

## 296 **10.4 DELETE Method**

297 The HTTP DELETE method deletes an entity instance

#### 298 **Client DELETE request**

299 N/A

#### 300 **Server DELETE response**

301 Upon a successful processing of the request, the *200 OK* or *204 No Content* status code MUST be returned.

## 302 **11 HTTP Methods Applied to Collections**

303 This section describes the HTTP methods used to retrieve and manipulate collections. A collection refers to a  
304 set of *entity instances*.

305 Each HTTP method described is assumed to operate on an URL referring to a collection, an URL such as the  
306 following:

307 `http://example.com/compute/`

308 The renderings for the entity instance, entity *collection* and *action* instances are defined in [8] and [9].

### 309 **11.1 GET Method**

310 The HTTP GET method retrieves a rendering of a collection of existing entity instances.

#### 311 **Client GET request**

312 The request MAY include a possible filter rendering.

#### 313 **Server GET response**

314 The response MUST include an entity collection rendering.

315 Upon a successful processing of the request, the *200 OK* status code MUST be returned.

## 316 11.2 PUT Method

317 The HTTP PUT is only defined for a collection defined by a **Mixin**. It makes replacing the collection possible.

### 318 Client PUT request

319 The request MUST include an entity collection rendering.

### 320 Server PUT response

321 The response MUST include an entity collection rendering.

322 Upon a successful processing of the request, the *200 OK* status code MUST be returned.

## 323 11.3 POST Method

324 The HTTP POST method is defined for *creation* of an entity instance, *association* of entity instance with a  
325 **Mixin** and triggering *actions*.

### 326 11.3.1 Create Entity Instance

#### 327 Client POST request

328 The request MUST include at least one full entity instance rendering. It MAY include an entity collection  
329 rendering.

#### 330 Server POST response

331 The OCCI implementation MAY return either the *201 Created* or *200 OK* status code. If the OCCI implemen-  
332 tation returns the *200 OK* status code, an entity instance rendering or collection rendering MUST be included  
333 as well. In case of the *201 Created* status code, an entity instance location (as defined in RFC7231 [5]) or a  
334 list of entity instance locations MUST be included.

### 335 11.3.2 Associate Mixin with Entity Instance

336 This operation MUST only be available for collections defined by a **Mixin**.

#### 337 Client POST request

338 The request MUST include an entity collection rendering which require the **Mixin** to be applied.

#### 339 Server POST response

340 On successful operation the server replies with the *200 OK* HTTP status code it MUST include an entity  
341 collection rendering.

### 342 11.3.3 Trigger Action

343 Actions are triggered using the HTTP POST verb and by adding a query string to the URL. This query MUST  
344 contain a key-value pair. The key MUST be 'action'. The value MUST equal to the **Action**'s term.

#### 345 Client POST request

346 The request MUST contain an action invocation rendering.

### 347 **Server POST response**

348 The HTTP GET response MAY contain an entity collection rendering or a **Category** collection rendering  
349 depending on the requirements of the specified **Action**.

350 Upon a successful processing of the request, the *200 OK* status code MUST be returned.

## 351 **11.4 DELETE Method**

352 The HTTP delete method is used to either *delete* all entity instances in a collection or *disassociate* entity  
353 instance from a collection defined by a **Mixin**.

### 354 **11.4.1 Delete Entity Instances**

#### 355 **Client DELETE request**

356 N/A

#### 357 **Server DELETE response**

358 Upon a successful processing of the request, the *200 OK* or *204 No Content* status code MUST be returned.

### 359 **11.4.2 Disassociate Mixin from Entity Instances**

360 This operation MUST only be available for collections defined by a **Mixin**.

#### 361 **Client DELETE request**

362 The request MAY include entity collection rendering which requires the **Mixin** to be disassociated.

#### 363 **Server DELETE response**

364 Upon a successful processing of the request, the *200 OK* status code MUST be returned.

## 365 **12 Security Considerations**

366 The OCCI HTTP rendering assumes HTTP or HTTP-related mechanisms for security. As such, implementations  
367 SHOULD support TLS<sup>3</sup> for transport layer security.

368 Authentication SHOULD be realized by HTTP authentication mechanisms, namely HTTP Basic or Digest  
369 Auth [10], with the former as default. Additional profiles MAY specify other methods and should ensure that  
370 the selected authentication scheme can be rendered over the HTTP or HTTP-related protocols.

371 Authorization is not enforced on the protocol level, but SHOULD be performed by the implementation. For  
372 the authorization decision, the authentication information as provided by the mechanisms described above  
373 MUST be used.

374 Protection against potential Denial-of-Service scenarios is out of scope of this document; the OCCI HTTP  
375 Protocol specification assumes cooperative clients that SHOULD use selection and filtering as provided by  
376 the Category mechanism wherever possible. Additional profiles to this document, however, MAY specifically  
377 address such scenarios; in that case, best practices from the HTTP ecosystem and appropriate mechanisms as  
378 part of the HTTP protocol specification SHOULD be preferred.

379 As long as specific extensions of the OCCI Core and Model specification do not impose additional security  
380 requirements on top of the OCCI Core and Model specification itself, the security considerations documented  
381 above apply to all (existing and future) extensions. Otherwise, an additional profile to this specification MUST  
382 be provided; this profile MUST express all additional security considerations using HTTP mechanisms.

383 **13 Glossary**

Term	Description
Action	An OCCI base type. Represents an invocable operation on an <b>Entity</b> sub-type instance or collection thereof.
Attribute	A type in the OCCI Core Model. Describes the name and properties of attributes found in <b>Entity</b> types.
Category	A type in the OCCI Core Model and the basis of the OCCI type identification mechanism. The parent type of <b>Kind</b> .
capabilities	In the context of <b>Entity</b> sub-types <b>capabilities</b> refer to the <b>Attributes</b> and <b>Actions</b> exposed by an <b>entity instance</b> .
Collection	A set of <b>Entity</b> sub-type instances all associated to a particular <b>Kind</b> or <b>Mixin</b> instance.
Entity	An OCCI base type. The parent type of <b>Resource</b> and <b>Link</b> .
entity instance	An instance of a sub-type of <b>Entity</b> but not an instance of the <b>Entity</b> type itself. The OCCI model defines two sub-types of <b>Entity</b> : the <b>Resource</b> type and the <b>Link</b> type. However, the term <i>entity instance</i> is defined to include any instance of a sub-type of <b>Resource</b> or <b>Link</b> as well.
Kind	A type in the OCCI Core Model. A core component of the OCCI classification system.
384 Link	An OCCI base type. A <b>Link</b> instance associates one <b>Resource</b> instance with another.
Mixin	A type in the OCCI Core Model. A core component of the OCCI classification system.
mix-in	An instance of the <b>Mixin</b> type associated with an <i>entity instance</i> . The “mix-in” concept as used by OCCI <i>only</i> applies to instances, never to <b>Entity</b> types.
OCCI	Open Cloud Computing Interface.
OGF	Open Grid Forum.
Resource	An OCCI base type. The parent type for all domain-specific <b>Resource</b> sub-types.
resource instance	See <i>entity instance</i> . This term is considered obsolete.
tag	A <b>Mixin</b> instance with no attributes or actions defined. Used for taxonomic organisation of entity instances.
template	A <b>Mixin</b> instance which if associated at instance creation-time pre-populate certain attributes.
type	One of the types defined by the OCCI Core Model. The Core Model types are <b>Category</b> , <b>Attribute</b> , <b>Kind</b> , <b>Mixin</b> , <b>Action</b> , <b>Entity</b> , <b>Resource</b> and <b>Link</b> .
concrete type/sub-type	A concrete type/sub-type is a type that can be instantiated.
URI	Uniform Resource Identifier.
URL	Uniform Resource Locator.
385 URN	Uniform Resource Name.

386 **14 Contributors**

387 We would like to thank the following people who contributed to this document:

Name	Affiliation	Contact
Michael Behrens	R2AD	behrens.cloud at r2ad.com
Mark Carlson	Toshiba	mark at carlson.net
Augusto Ciuffoletti	University of Pisa	augusto.ciuffoletti at gmail.com
Andy Edmonds	ICCLab, ZHAW	edmo at zhaw.ch
Sam Johnston	Google	samj at samj.net
Gary Mazzaferro	Independent	garymazzaferro at gmail.com
Thijs Metsch	Intel	thijs.metsch at intel.com
388 Ralf Nyrén	Independent	ralf at nyren.net
Alexander Papaspyrou	Adesso	alexander at papaspyrou.name
Boris Parák	CESNET	parak at cesnet.cz
Alexis Richardson	Weaveworks	alexis.richardson at gmail.com
Shlomo Swidler	Orchestratus	shlomo.swidler at orchestratus.com
Florian Feldhaus	Independent	florian.feldhaus at gmail.com
Zdeněk Šustr	CESNET	zdenek.sustr at cesnet.cz
Jean Parpaillon	Inria	jean.parpaillon at inria.fr
Philippe Merle	Inria	philippe.merle@inria.fr

389 Next to these individual contributions we value the contributions from the OCCI working group.

## 390 15 Intellectual Property Statement

391 The OGF takes no position regarding the validity or scope of any intellectual property or other rights that  
 392 might be claimed to pertain to the implementation or use of the technology described in this document or the  
 393 extent to which any license under such rights might or might not be available; neither does it represent that  
 394 it has made any effort to identify any such rights. Copies of claims of rights made available for publication  
 395 and any assurances of licenses to be made available, or the result of an attempt made to obtain a general  
 396 license or permission for the use of such proprietary rights by implementers or users of this specification can be  
 397 obtained from the OGF Secretariat.

398 The OGF invites any interested party to bring to its attention any copyrights, patents or patent applications,  
 399 or other proprietary rights which may cover technology that may be required to practice this recommendation.  
 400 Please address the information to the OGF Executive Director.

## 401 16 Disclaimer

402 This document and the information contained herein is provided on an “As Is” basis and the OGF disclaims all  
 403 warranties, express or implied, including but not limited to any warranty that the use of the information herein  
 404 will not infringe any rights or any implied warranties of merchantability or fitness for a particular purpose.

## 405 17 Full Copyright Notice

406 Copyright © Open Grid Forum (2009-2016). All Rights Reserved.

407 This document and translations of it may be copied and furnished to others, and derivative works that comment  
 408 on or otherwise explain it or assist in its implementation may be prepared, copied, published and distributed, in  
 409 whole or in part, without restriction of any kind, provided that the above copyright notice and this paragraph  
 410 are included as references to the derived portions on all such copies and derivative works. The published OGF  
 411 document from which such works are derived, however, may not be modified in any way, such as by removing  
 412 the copyright notice or references to the OGF or other organizations, except as needed for the purpose of  
 413 developing new or updated OGF documents in conformance with the procedures defined in the OGF Document  
 414 Process, or as required to translate it into languages other than English. OGF, with the approval of its board,  
 415 may remove this restriction for inclusion of OGF document content for the purpose of producing standards in  
 416 cooperation with other international standards bodies.

417 The limited permissions granted above are perpetual and will not be revoked by the OGF or its successors or  
418 assignees.
